

WHAT IS CLAIMED IS:

1. A signal evaluation method configured to evaluate a reproduction equalization signal reproduced from a recording medium by use of a PRML (partial response and maximum likelihood) discrimination method,
5 said method comprising the steps of:
 - detecting matching between discrimination data and a plurality of predetermined bit sequence pairs of different groups;
 - 10 calculating a bit sequence and corresponding two ideal responses when the matching is detected;
 - obtaining Euclidean distances between the two ideal responses and equalization signals;
 - obtaining a difference between the Euclidean
15 distances;
 - obtaining a mean value and a standard deviation with respect to the difference between the Euclidean distances; and
 - calculating a quality evaluation value of a
20 reproduction signal based on the mean value, the standard deviation, an appearance probability of the predetermined bit sequence, and a Hamming distance between the predetermined bit sequence pairs.
2. A signal evaluation method according to
25 claim 1, wherein said quality evaluation signal is used as a first evaluation value, a target signal is calculated based on a predetermined data sequence and

a predetermined partial response characteristic,
an equalization error representing a difference in
reproduction equalization signals is calculated in each
clock period, a second evaluation value based on the
autocorrelation of said equalization error is used as
an evaluation value for evaluating the signal quality,
and said first evaluation value and said second
evaluation value are used in combination to obtain
final evaluation.

3. A signal evaluation method according to
claim 2, wherein the final evaluation is made based on
the first evaluation value, the second evaluation
value, and a third evaluation value, the third
evaluation value being provided by an error correction
decoder and attributable mainly to a medium defect.

4. A signal evaluation method according to
claim 1, wherein said quality evaluation value is used
as a first evaluation value, and the final evaluation
is made based on the first evaluation value and a third
evaluation value, the third evaluation value being
provided by an error correction decoder and
attributable mainly to a medium defect.

5. A signal evaluation method according to any
one of claims 1, 2, 3 and 4, wherein the evaluation
value is calculated by use of equalization signals
corresponding to 100,000 channel bits or more.

6. An apparatus used as one of an information

recording/reproducing apparatus and an information reproducing apparatus and outputting reproduction signals reproduced from a recording medium by use of a PRML (partial response and maximum likelihood)

5 discrimination method, said apparatus comprising signal reproduction evaluation means including:

means for detecting matching between discrimination data and a plurality of predetermined bit sequence pairs of different groups;

10 means for calculating a bit sequence and corresponding two ideal responses when the matching is detected;

means for obtaining Euclidean distances between the two ideal responses and equalization signals;

15 means for obtaining a difference between the Euclidean distances;

means for obtaining a mean value and a standard deviation with respect to the difference between the Euclidean distances; and

20 means for calculating a quality evaluation value of a reproduction signal based on the mean value, the standard deviation, an appearance probability of the predetermined bit sequence, and a Hamming distance between the predetermined bit sequence pairs.

25 7. An apparatus according to claim 6, further comprising:

means for adjusting a recording waveform by use of

a value calculated based on the mean value and the standard deviation.

8. An apparatus used as one of an information recording/reproducing apparatus and an information reproducing apparatus and configured to produce an evaluation value by use of a signal evaluation method described in any one of claims 1, 2, 3, and 4, said apparatus comprising means for performing at least one of: adjustment of a recording waveform; an offset adjustment of a reproduction signal; gain adjustment; adjustment of an equalization coefficient; tracking control; focusing control; tilting control; and the adjustment of a spherical aberration.

9. An apparatus according to any one of claims 5, 6 and 7, wherein the evaluation value is calculated by use of equalization signals corresponding to 100,000 channel bits or more.

10. An information recording medium from which reproduction signals are reproduced by use of a PRML (partial response and maximum likelihood) discrimination method, the reproduction signals being evaluated based on an evaluation value obtained by:

detecting matching between discrimination data and a plurality of predetermined bit sequence pairs of different groups;

calculating a bit sequence and corresponding two ideal responses when the matching is detected;

obtaining Euclidean distances between the two
ideal responses and equalization signals;

obtaining a difference between the Euclidean
distances;

5 obtaining a mean value and a standard deviation
with respect to the difference between the Euclidean
distances; and

 calculating a quality evaluation value of a
reproduction signal based on the mean value, the
10 standard deviation, an appearance probability of the
predetermined bit sequence, and a Hamming distance
between the predetermined bit sequence pairs,

 said information recording medium satisfying a
requirement that the evaluation value is not more than
15 10×10^{-3} .

11. An information recording medium according to
claim 10, wherein said quality evaluation signal is
used as a first evaluation value, a target signal is
calculated based on a predetermined data sequence and a
20 predetermined partial response characteristic, an
equalization error representing a difference in
reproduction equalization signals is calculated in each
clock period, a second evaluation value based on the
autocorrelation of the equalization error is used as an
25 evaluation value for evaluating the signal quality, and
said first evaluation value and said second evaluation
value are used in combination to obtain final

evaluation,

said information recording medium satisfying a
requirement that the first evaluation value is not more
than 10×10^{-3} and the second evaluation value is not
5 less than 12.

12. A recording information medium according to
claim 11, wherein the final evaluation is made based on
the first evaluation value, the second evaluation value
and a third evaluation value, the third evaluation
10 value being provided by an error correction decoder,
which performs error correction with respect to the
reproduction signals, and attributable mainly to a
medium defect,

said information recording medium satisfying a
15 requirement that the first evaluation value is not more
than 10×10^{-3} , the second evaluation value is not less
than 12, and the third evaluation value is not more
than 280 for 8 ECC consecutive blocks.

13. An information recording medium according to
20 claim 10, wherein said quality evaluation signal is
used as a first evaluation value, a target signal is
calculated based on a predetermined data sequence and
a predetermined partial response characteristic, an
equalization error representing a difference in
25 reproduction equalization signals is calculated in each
clock period, a second evaluation value based on the
autocorrelation of the equalization error is used as an

evaluation value for evaluating the signal quality, and said first evaluation value and said second evaluation value are used in combination to obtain final evaluation,

5 said information recording medium satisfying a requirement that the second evaluation value is not less than 15.

14. An information recording medium from which reproduction signals are reproduced by use of a PRML
10 (partial response and maximum likelihood) discrimination method, the reproduction signals being evaluated based on an evaluation value obtained by:

detecting matching between discrimination data and a plurality of predetermined bit sequence pairs of
15 different groups;

calculating a bit sequence and corresponding two ideal responses when the matching is detected;

obtaining Euclidean distances between the two ideal responses and equalization signals;

20 obtaining a difference between the Euclidean distances;

obtaining a mean value and a standard deviation with respect to the difference between the Euclidean distances; and

25 calculating a quality evaluation value of a reproduction signal based on the mean value, the standard deviation, an appearance probability of the

predetermined bit sequence, and a Hamming distance between the predetermined bit sequence pairs,

5 said information recording medium satisfying a requirement that the evaluation value is not more than 10×10^{-5} .

15 15. An information recording medium according to claim 14, wherein said quality evaluation signal is used as a first evaluation value, a target signal is calculated based on a predetermined data sequence and a
10 predetermined partial response characteristic, an equalization error representing a difference in reproduction equalization signals is calculated in each clock period, a second evaluation value based on the autocorrelation of the equalization error is used as an
15 evaluation value for evaluating the signal quality, and said first evaluation value and said second evaluation value are used in combination to obtain final evaluation,

20 said information recording medium satisfying a requirement that the first evaluation value is not more than 10×10^{-5} and the second evaluation value is not less than 15.

25 16. A recording information medium according to claim 15, wherein the final evaluation is made based on the first evaluation value, the second evaluation value and a third evaluation value, the third evaluation value being provided by an error correction decoder,

which performs error correction with respect to the reproduction signals, and attributable mainly to a medium defect,

5 said information recording medium satisfying a requirement that the first evaluation value is not more than 10×10^{-5} , the second evaluation value is not less than 15, and the third evaluation value is not more than 280 for 8 consecutive ECC blocks.
